

HELGI COLLABORATION

Conference Room Collaboration Solution

For meetings to be as effective and engaging as possible, features as **web and video conferencing** with features like screen sharing, Instant Messaging and whiteboard are almost mandatory. Without these capabilities, people lose the benefits of rich interaction, remote participants have a sub-optimal experience and the whole team is less productive due to longer meeting startup times.

HELGI Collaboration is the perfect solution for any collaborative, video-conferencing-based working environment. **HELGI Collaboration** makes any operation easy thanks to a Windows 10 launcher meant to work seamlessly with HELGI IFPs (Interactive Flat Panels).

Based on Windows 10, the launcher is totally customizable by the administrator to show only the applications needed by the end users,

such as Skype, the Web browser, Office applications etc. It's a safe, user-friendly solution: any user, regardless of the level of proficiency in the use of digital solutions, will be able to start a videoconference, use a digital whiteboard, share contents and ideas with colleagues, both in presence or in remote.

HELGI Collaboration can be provided with the exclusive Helgi Marker, a tool able to transform anything written with dry-erase markers on any regular whiteboard in a digital content, streamed live on the Whiteboard application native of the **HELGI Collaboration** launcher. Moreover, real-time mirroring supports any kind of device (iOS, Android, Windows, Mac OS etc.) so that the participants can mirror their devices on the main monitor to easily share contents and contributions.

 Skype for Business

 GoToMeeting

 Vidyo

 webex

“Unlimited users, unlimited devices, unlimited brainstorming.”

SOLUTION 1

External Compute Card Dock

Compute Card Dock

This is the external chassis of the Compute Card: tiny, lightweight and with a full array of I/O ports, it can be easily placed everywhere in the meeting room and connected with the HELGI Interactive Flat Panels for an astounding user experience

Compute Card

This is the heart of the **HELGI Collaboration** solution: based on an Intel processor, it includes the **HELGI Collaboration** Windows 10 launcher, and it's ready to start working as soon as it is switched on

SOLUTION 2

Interactive Flat Panel
with Embedded mini PC

An all-in-one solution

Our cable-less, zero-clutter solution: the Interactive Flat Panel is provided with a mini PC on the inside, provided with all the **HELGI Collaboration** applications.

This is the most convenient, user-friendly and elegant solution, ideal for highly styled workplaces, huddle and meeting rooms. You don't need any external PC, any cable running to the monitor: one push on the ON button, and everything is ready for your brainstorming session, videoconference or presentation. No time wasted on setups, configurations or installations thanks to the Airserver technology, which allows real-time, multi-user mirroring from any device using native protocols.

Helgi Marker

Include whiteboard content in live sessions

Turn into vector traces, in real time, notes and drawings made with dry markers on a normal whiteboard. Meetings become truly interactive by mixing analog and digital in a simple and natural way! Helgi Marker turns real ink into digital data, transmits it wirelessly to the Whiteboard application and makes it sharable by remote participants via Skype or other video conferencing software.

Including hand-drawn content makes the **HELGI Collaboration** solution even more user-friendly, increasing the level of participation thanks to the possibility of creating a shared virtual whiteboard, over which the participants can work together remotely, in real time.

Air Gesture

Voice / gesture control

HELGI Collaboration Air gesture control and Intel RealSense camera wants to bring the touchless gesture controls seen in the science-fiction film "Minority Report" to everyday consumer / professional electronic devices, starting with Windows 10.

Intel RealSense technology transforms video calls allowing you to project users into a collaborative virtual environment using ChromaKey, an effect much like network TV news broadcasts. Create your own background, hiding the office clutter behind you. This option allows Air-Gesture commands and provides the system with camera and microphone capabilities.

Wireless Presentation & Collaboration

With Helgi wireless collaboration capabilities, everyone in the meeting can stream directly from any device to a large format display. Make your content the center of attention with a more focused and connected meeting room.

Shared Whiteboards

Meeting rooms are transforming with the use of virtual whiteboards allowing attendees to view and edit content from wherever they are. We work with you on a solution that allows you to take full advantage of this technology to increase productivity, creativity and collaboration.

Collaborative Presentations

With Helgi Collaboration Suite join a video conference with a single tap, click or Air-gesture and share content effortlessly. No setup is required so you spend more time connecting with people. Voice command available soon.

We Engineer for Touch

The HELGI Collaboration launcher is designed to be used on a large interactive touch screen: there is no faster and easier way than tapping on an icon, launch any application, write or annotate on the Whiteboard app and share the material.

Native wireless display protocols support

No more apps or extra devices needed!

HELGI Collaboration Airserver is the most advanced mirroring software available. Designed for Windows 10 OS, it allows to share in real time and simultaneously the screen of any iOS device (AirplayTM), Android, Chrome or Windows (Google CastTM) using native mirroring protocols.
